

Welcome, The Burg

Your AI order line — how it works and what to do

What you now have

A phone line answered by your own AI — every call, every time, even three at once at 1am. It knows your full menu and prices, takes the order, reads it back for confirmation, sends a ticket to your kitchen, and logs everything in your dashboard. No busy signals. No missed orders. Payment stays exactly as it is today: at pickup.

How an order happens

1. **Customer calls** your number. The AI answers instantly — friendly, fast, and it will say it's an AI if asked.
2. **It takes the order** item by item, confirms each one back (“one large pepperoni, extra cheese — got it”), and knows the whole menu, prices, and that everything is halal.
3. **Full read-back:** the complete order, total, and pickup time — the customer confirms before anything is placed.
4. **Kitchen gets the ticket** the moment they confirm — items, modifiers, any allergy flagged in bold, total, pickup time.
5. **You see everything** in your dashboard: the order, the call recording, the day's totals.

What you do each day (about 90 seconds)

Open the app (we'll install it on your phone — it works like any app). Glance at the numbers: calls answered, orders taken, money. Tap anything that's waiting for you. That's it. If the AI ever hears a question it can't answer, it saves it for you — you approve the answer once, and it knows it forever. Your AI literally gets smarter about YOUR shop every week.

You are always in control

- The line only answers when your phone's call-forwarding is on — **you can turn it off from your own phone in 30 seconds**, any time, no call to us needed.
- Pause the AI with one tap in the app.
- Every call is recorded and every order logged — you can always hear exactly what was said.

Honest fine print

- In week one it may fumble an unusual special request — it reads every order back, and when it truly can't handle something, it takes a name and number for a human callback instead of guessing. We review the recordings and fix anything fast.
- Customer confirmation text-messages switch on once carrier registration clears (a standard telecom step, in progress).
- Orders print to your kitchen by ticket message now; direct SkyTab entry is phase two, pending Shift4's

partner approval.
